

## Are You Prepared?

Can you afford to lose your valuable data in the event of a disaster, and in so doing run the risk of losing vast amounts of revenue or even worse, never being able to recover?

According to a study by the University of Texas Center for Research on Information Systems, nearly half the companies that lose their data in a disaster never reopen, and 90% are out of business within two years.

It is therefore very important, in these trying economic times to be better prepared than your competition in order to survive.

No one is exempt from disaster and most are ill prepared should disaster strike. A disaster can be defined as any event that will significantly impact the company's operations, these can include the following:

- Natural or cataclysmic events (i.e. fire, flood, electrical storm).
- Human behavior (i.e. arson, bomb threat, robbery).
- Technological breakdowns (i.e. server crash, hard drive crash).

Many companies have some system whereby regular backups are made of their data. All too often, however, the back-ups fail as the integrity of the data and media is generally not tested.

As companies start relying more heavily on their computer systems and data, so too is the need for a detailed disaster recovery and business continuity plan is becoming increasingly more important.

### **Our Online Backup Service - Key Features:**

- Fully automated online back-up solution onto a secure, remote server
- Instant access to all your data
- Backup for all your computers, laptops and servers
- Total peace of mind through data recovery
- Access to your data 24/7
